SUPPLEMENTARY FIGURES

Supplementary Fig. (1). Similarity of molecules related to their potential neuroprotective response. The central cluster of the heatmap contains the analogs of nicotine, nicotine and TC-1698, both related to a neuroprotective *in vitro* positive activity over $\alpha 7$ nAChR.

Supplementary Fig. (2). Principal component analysis of the manually curated dataset. 0 represents the antagonist function over the receptor (no neuroprotection) and 1 indicates the molecules related with a positive response of $\alpha 7$ nAChR and putative induction of PI3K/AKT Bcl-2.

Supplementary Fig. (3). K-mean analysis of the manually curated dataset. The number of clusters were set to be self-organized and the clusters tend to organize the molecules by the activity over the receptor.
